HCM TOPO Viewer V2.0 setup

There is a setup.exe, but I'm not sure that it is in your language or in the original German language. This program normally install the program on your computer in an own directory of the program folder.

But there is an alternative setup procedure:

If you have already installed a VB6 Program, you have already all runtime files on your computer. In this case, browse the subdirectory Support and select the HCM_TOPO_Viewer.exe. Copy it to a directory of your choice where you have full writing access. Start the program and do the setting for Drive.dat and the picture directory.

If you don't have installed a VB6 program, either download the VB6 Runtime files from Microsoft and install it or copy all *.dll files from the Support Subdirectory to your Windows.System32 directory and then do the things described in the previous section.

In any case, it is recommended to store the HCM_TOPO_Viewer.exe in a directory, where you have full writing access and specially to define the Picture directory to a directory, where you have writing access.
